WORKSHOP

TCP SOCKET APPLICATION-1

Objective:

Here the objective is to communicate between **TWO** processes over a network i.e.., **SERVER** and **CLIENT ,** with help of **SOCKET** programming by using **TCP / UDP** protocols.

TASK:

Here client will send message (requirement)to server and server will give result to client.

1. Client will ask server to provide **N** prime numbers starts from **S** by sending **MSG** to server.

2. Server will receive **MSG** from client and will give result to client based on requirement.

Note: Here , **MSG** is a string and it has some standard i.e..,

MSG: "N prime numbers from S"

If client not following proper format to send MSG to server , then server should send ERROR message to client i.e.., "result not found"

3. If client sending MSG in proper format , then server should send integer data as a result to client.

Requirements:

Your **TASK** requires **TWO** Processes. Here Process1 is **SERVER** and Proccess2 is **CLIENT.**

SERVER always should behave as demon process (It should not print anything on screen).

Follow bellow given diagram to implement **server** and **client**
